

**Program # 1**

Line #	Python Code
1	data = 50
2	try:
3	data = data/0
4	except ZeroDivisionError:
5	print('Cannot divide by 0 ', end = '')
6	else:
7	print('Division successful ', end = '')
8	
9	try:
10	data = data/5
11	except:
12	print('Inside except block ', end = '')
13	else:
14	print('GFG', end = '')

Output:

Cannot divide by 0 GFG

Justification:

Because ZeroDivisionError occurred, else block will not run in line 9, try will run, there will be no exception, else block will run there.
